TECHNICAL REPORT SERIES CANADIAN WILDLIFE SERVICE

This series of reports, established in 1986, contains technical and scientific information from projects of the Canadian Wildlife Service. The reports are intended to make available material that either is of interest to a limited audience or is too extensive to be accommodated in scientific journals or in existing CWS series.

Demand for these Technical Reports is usually confined to specialists in the fields concerned. Consequently, they are produced regionally and in small quantities; they can be obtained only from the address given on the back of the title page. However, they are numbered nationally. The recommended citation appears on the title page.

Technical Reports are available in CWS libraries and are listed with the DOBIS system in major scientific libraries across Canada. They are printed in the official language chosen by the author to meet the language preference of the likely audience. **To determine whether there is significant demand for making the reports available in the second official language, CWS invites users to specify their official language preference. Requests for Technical Reports in the second official language should be sent to the address on the back of the title page.**

SÉRIE DE RAPPORTS TECHNIQUES DU SERVICE CANADIEN DE LA FAUNE

Cette série de rapports donnant des informations scientifiques et techniques sur les projets du Service canadien de la faune (SCF) a démarré en 1986. L'objet de ces rapports est de promouvoir la diffusion d'études s'adressant à un public restreint ou trop volumineuses pour paraître dans une revue scientifique ou l'une des séries du SCF.

Ordinairement, seuls les spécialistes des sujets traités demandent ces rapports techniques. Ces documents ne sont donc produits qu'à l'échelon régional et en quantités limitées; ils ne peuvent être obtenus qu'à l'adresse figurant au dos de la page titre. Cependant, leur numérotage est effectué à l'échelle nationale. La citation recommandée apparaît à la page titre.

Ces rapports se trouvent dans les bibliothèques du SCF et figurent aussi dans les listes du système de référence DOBIS utilisé dans les principales bibliothèques scientifiques du Canada. Ils sont publiés dans la langue officielle choisie par l'auteur en fonction du public visé. **En vue de déterminer si la demande est suffisamment importante pour produire ces rapports dans la deuxième langue officielle, le SCF invite les usagers à lui indiquer leur langue officielle préférée. Il faut envoyer les demandes de rapports techniques dans la deuxième langue officielle à l'adresse indiquée au verso de la page titre.**

ABSTRACT

Over 1.5 million birds were counted by members of the Vancouver Natural History Society between March 1988 and February 1989 in the intertidal portion of the Fraser River delta, British Columbia. One-hundred and fifty species were identified. About 250,000 birds were reported in each of October, November and December when seasonal populations were greatest. The lowest number occurred in June when about 11,000 birds were seen. The most often seen birds were shorebirds (38.9%) followed by dabbling ducks (27.1%) and diving ducks (20.6%). The most often seen species was the Dunlin (Calidris alpina).

Most birds occurred in Boundary Bay along the northwest corner of the bay, and near 112th Street at the eastern end of the bay. The estuarine marshes at the mouth of the Fraser River held about a quarter of all birds recorded. The largest numbers in those marshes occurred off Westham Island and Brunswick Point. The Harlequin Duck (Histrionicus histrionicus) was confined to Ocean Park in White Rock, and the Ruddy Duck (Oxyura jamaicensis) occurred mostly at Iona Island. The results indicate that the entire intertidal portion of the Fraser River delta is used by a large number of birds and several sites must be secured to retain the present variety of species.

SOMMAIRE

Les membres de la Vancouver Natural History Society ont relevé plus de 1,5 million d'oiseaux entre les mois de mars 1988 et de février 1989, dans la zone intertidale du delta du fleuve Fraser en Colombie-Britannique. Cent cinquante différentes espèces ont été identifiées. On a signalé 250 000 oiseaux environ par mois, en octobre, novembre et décembre, à l'époque où les peuplements de saison sont les plus fréquents. La période creuse a été le mois de juin puisque environ 11 000 oiseaux ont été recensés. Les plus courants étaient les oiseaux de rivage (38,9%), suivis des barboteurs (27,1%) et des canards plongeurs (20,6%). L'espèce la plus communément rencontrée était le Bécasseau variable (*Calidris alpina*).

La majorité des oiseaux ont été trouvés dans l'angle nord-ouest de la baie Boundary et près de la 112^e rue à l'extrémité est de la baie. Environ un quart de l'ensemble des oiseaux rencontrés se trouvaient dans les marais d'estuaire à l'embouchure du fleuve Fraser, la majorité au large de l'île Westham et de la pointe Brunswick. L'habitat du Canard arlequin (*Histrionicus histrionicus*) était limité à Ocean Park à White Rock tandis que l'on rencontrait le Canard roux (*Oxyura jamaicensis*) principalement sur l'île Iona. Les résultats montrent que toute la zone intertidale du delta du fleuve Fraser attire un nombre considérable d'oiseaux et que plusieurs sites doivent être préservés afin de maintenir la variété actuelle des espèces.

1. INTRODUCTION

The Fraser River delta (49 10'N, 123 05'W) supports more birds than all other estuaries on the Pacific coast of Canada (Butler and Campbell 1987, Butler et al. 1989). Bird populations in the delta have been estimated for mostly large segments of the delta such as riverine marshes and Boundary Bay (e.g. Vermeer and Levings 1977, Campbell et al. 1972, McKelvey et al. 1985). Savard's (1985) study counted waterfowl at 19 sites around the delta in autumn and winter. However, there is no information on the numbers of all birds using the entire shoreline of the Fraser River delta around the year.

The purpose of this study was to compare the monthly use by all birds of small segments of the Fraser River delta seaward of the dykes throughout the year.

2. STUDY AREA AND METHODS

Study Area

The study area included the intertidal lands seaward of the dikes from Iona Island in the north to White Rock in the south (Fig. 1). Aquatic birds use two major ecosystems in the Fraser River delta (Butler and Campbell 1987). Those ecosystems include the estuarine marshes, mudflats and sandflats from Iona Island to Brunswick Point (stations 1-6) and the marine beaches from Tsawwassen, through Boundary Bay to White Rock (stations 7-17).

FIGURE 1

Boundaries of seventeen stations where birds were counted in the Fraser River delta.

Methods

The study was divided into 17 stations in which two observers could count all the birds in 2-3 hours (Fig. 1). Birds were counted from March 1988 to February 1989. Counts were made within two hours of the high tide on one preselected Saturday or Sunday following the spring tide each month. Before each count, team leaders were mailed a recording sheet with a list of species, the date and time of the count and a postage-paid return envelope. Observers walked the dyke near the high tide line and recorded all species seen through binoculars and spotting telescope. When flocks were too far to be identified to species, the numbers of birds were recorded as generic groups, such as scaup species, or duck species.

Data analysis

The data provide a snapshot of the distribution of birds during high tides once each month. Species that rapidly migrate through the delta may be missed or counted when populations are low. On the other hand, birds which reside in the delta for longer periods may be counted repeatedly. To account for this we confined most analyses to within-month comparisons.

One or more counts were missed at eight out of 17 stations. We estimated how many birds might have been seen at these stations by assuming the same proportion counted between stations on the previous month also occurred on the month with the missing count. These methods were only used to estimate total numbers of all birds seen at each station and the numbers are identified in the tables. Stations 16 and 17 had too many missing counts and so were not included in these totals.

Data were analyzed by month for each of 17 stations and as a total of all birds seen each month. Counts from stations 7 and 8 were combined so that all stations were about equal in area. Scientific, vernacular and codes for vernacular names appear in Appendix 1. A summary of all birds counted at each station appears in Appendix 2.

3. RESULTS AND DISCUSSION

Seasonal comparisons

About 250,000 birds were seen in October, November and December when populations were greatest (Table 1). These huge populations were mostly migrant Dunlin and ducks. Many shorebirds and ducks move farther south but large populations spend the winter in the delta. Populations rise again during spring migration, especially when Dunlin and Western Sandpipers arrive. Most birds have departed by May and the delta populations remain low through September except when Western and Least sandpipers arrive on their southward migration in July (Table 1).

Species comparisons

Loons

Four species of loons were recorded. Red-throated Loons were recorded at 13 out of 17 stations (Table 2). In May, over 800 loons were seen off Westham Island. They were recorded as "Loon spp." in Table 2. The Red-throated Loon is the commonest species in the river (Butler and Campbell 1987). If these were indeed Red-throated Loons, then this species would account for over 90% of all loons seen in the estuary.

Table 1. Total number of major bird groups counted on one day each month in the Fraser River delta.

Pacific Loons were seen only in the more marine ecosystem of Boundary Bay and south Roberts Bank (Table 2). In contrast, Common Loons were seen throughout the study area with largest numbers reported between the B.C. Ferry and Westshore Terminal jetties (Table 2).

Grebes

Five species of grebes were seen. Pied-billed Grebes were most abundant near Westham Island and between the B.C. Ferry and Westshore Terminal jetties. Horned and Red-necked Grebes were widespread with concentrations off Sea Island, south Roberts Bank and White Rock (Table 2). Eared Grebes occurred mostly on south Roberts Bank, whereas Western Grebes were seen at nearly every station.

Cormorants and herons

Double-crested Cormorant and Great Blue Heron were widespread in the study area (Table 2). Double-crested cormorants concentrated off south Roberts Bank where they nest on river dolphins, whereas herons were most abundant in the marshes at the mouth of the Fraser River. Herons nest near the University of British Columbia, on Point Roberts and near Mud Bay. Brandt's and Pelagic cormorants were mostly seen along rocky coastlines near White Rock and near jetties on Roberts Bank.

Swans, geese and ducks

Two species of swan, four species of goose and 26 duck species were seen. Most (99.2%) swans were Trumpeters (Table 2). Swans mostly occurred near Brunswick Point and Westham Island. Snow Geese used the entire foreshore marshes of the Fraser, whereas Brant were confined to south Roberts Bank and Boundary Bay (Table 2). Canada Geese were more ubiquitous but were most often seen at Westham Island.

American Wigeon was the most abundant duck species. Large numbers occurred off Roberts Bank and especially in western Boundary Bay (Table 2). Northern Pintails were also widespread with large concentrations off south Roberts Bank, western Boundary Bay and near the mouth of Mud Bay (Table 2). Mallard were also widespread with a similar distribution to pintails. Exceptionally high concentrations occurred on Westham Island (Table 2). Green-winged Teal were most abundant in Boundary Bay.

Large numbers of diving ducks were seen near the limits of the observer's range. Of those identified to species, Greater Scaup predominated (Table 2). Most scaup were seen on south Roberts Bank. Harlequin Ducks were mostly restricted to Ocean Park. Surf Scoters were widespread but White-winged Scoters occurred mostly in Boundary Bay and south Roberts Bank. Ruddy Ducks were mostly abundant near Iona Island and Common Merganser were seen predominantly near the mouth of the Nicomekl River (Table 2).

Raptors

The Bald Eagle, Northern Harrier and Red-tailed Hawk were the most abundant raptors. All were widespread. Short-eared Owls were seen only near 88th Street at Boundary Bay and at Brunswick Point.

Shorebirds

Dunlin was the most often seen bird of the entire study. They were seen at nearly every station but particularly at the mouth of Mud Bay (Table 2). Western Sandpipers were also widespread. Black-bellied Plovers were concentrated in Boundary Bay, whereas Killdeer were widespread. Both species of yellowlegs predominated at Westham and Iona islands. Black Turnstones were most frequent on jetties on Roberts Bank and Common Snipe were mostly confined to marshes near the mouth of the Fraser River (Table 2).

Gulls and alcids

Most Glaucous-winged Gulls occurred on Boundary Bay beaches closest to the Delta garbage dump (Table 2). All species of gulls were widespread except the California Gull which was most often reported from Boundary Bay. Common Murres and Marbled Murrelets were sighted off the jetties on Roberts Bank, perhaps because the jetties provided observers access to deeper waters than other stations.

Passerines

European Starlings and Barn Swallows were the most abundant species and both were widespread (Table 2). Northwestern Crows were seen at most stations but were most numerous near wooded areas. Blackbirds were most abundant on Lulu and Westham islands.

High density areas

The number of birds counted or estimated at each station per month and the annual totals (Table 3 and Fig. 2). indicate that the northwest corner of Boundary Bay (stations 11 and 12) and the mouth of Mud Bay (station 4) were the most heavily used sites. Next was south Roberts Bank including the area between the B.C. Ferry Terminal jetties (stations 7 and 8) (6.8% of all birds), Brunswick Point (9.8%) and Westham Island (7.4%). This conclusion is based on the number of birds tallied per count (Table 3). It assumes that a single count each month closely reflects the relative use of each site by all birds. This is not entirely true since, for example, we know that large numbers of migrant sandpipers use Iona Island mudflats. The timing of our counts missed many of these. Moreover, our conclusions are based on incomplete counts. Stations 16 and 17 were counted eight and six times,

Table 3

Table 3. Number of birds counted each month at each station. Station numbers correspond with sites in Figure 1. Numbers in bold are estimates (see Methods).

Station	J	F	M	A	M	J	J	A	S	O	N	D	Total

a - Stations 16 (Ocean Park) and 17 (White Rock) had too few counts to be included in this comparison.

respectively. Station 16 (Ocean Park) is a rocky shoreline with generally lower numbers of birds than other stations. White Rock (station 17) is similar to beaches in Boundary Bay but is also used by many people. The significance of the size of bird populations at those two sites require further study.

Seasonal use

The northwest corner of Boundary Bay (stations 11 or 12 had the highest number of birds from September to April (Table 3). In May, birds were dispersed over south Roberts Bank and west Boundary Bay (stations 5-11 and 13). By June the largest numbers were noted in central Boundary Bay (station 13). During the southward shorebird migration in July and August, the greatest numbers were at the east end of Boundary Bay (station 14) and Brunswick Point (station 6), respectively.

Conservation of the birds in the delta

Over the last three decades conservation efforts have secured large portions of the estuarine marshes at the mouth of the Fraser River (Butler and Campbell 1987). These marshes are an important component in the preservation of many estuarine birds such as American Bittern, Trumpeter Swan and Snow Goose. However, only part of the most heavily used areas of the estuarine marshes along Roberts Bank are protected for wildlife. The George C. Reifel Migratory Bird Sanctuary and Alaksen National Wildlife Area on Roberts Bank and Reifel Island provide a variety of habitats and quiet resting areas and probably partly explain the high concentrations of birds in nearby areas.

The greatest numbers of birds were seen in Boundary Bay where tiny fragments of habitat have been secured for wildlife. The entire bay is heavily used with especially large concentrations near the entrance of Mud Bay and the northwest corner of Boundary Bay. The significance of these stations and adjacent uplands to the maintenance of current populations needs to be assessed.

Some stations reported low overall populations of birds but were nonetheless important to one or a few species. For example, Ocean Park supported over 85% of all Harlequin Ducks (Tables 2 and 3) even though the counts were incomplete. Similarly, over 80% of the Ruddy Ducks were reported from Iona Island (Table 2). The protection of species, such as these, requires identifying their precise habitat needs in the delta and coordinated planning with land owners.

Other species were more widespread but nonetheless confined to discrete areas of the delta. For example, the Snow Goose and American Bittern were seen only in the estuarine marshes at the mouth of the Fraser River, and Pacific Loons were most abundant in marine areas (Table 2). The task at hand is to determine the relative importance of each habitat in supplying the needs of the birds in the Fraser River delta.

4. ACKNOWLEDGEMENTS

This study took over 800 hours of volunteer effort by many conscientious members of the Vancouver Natural History Society without whose help such a project could not be done. Cooperative studies such as this, provide information that greatly assists conservation efforts. We thank June Banwell,

Kevin Bell, Dick Cannings, Bev Cline, Bill Crins, Mannik Dallerian, Helen Evans, Frieda Davidson, Bob Dundas, Dave Gired, Al and Jude Grass, Lea Haggert, Grabor Halasz, Tom Hanrahan, Ken Hall, Chris Harris, John Ireland, Ruth Jones, Linda Koch, Gwen Mason, Virginia Muir, Viveka Ohman, Stephen Partington, Tom Plath, Allen and Helen Poynter, Susan and Don Sargent, Kelly Sekhon, Daphne Solecki, Brian Self, Andy Stewart, Graham Sunderland, Mike Toochin, Rick and Danny Tyson, Audrey Viken, Elizabeth Walker, Peter Ward, and Doug Wilson.
